Contract Audit
Smart Fast

Smart Contract
Security Audit Report

Number: 0524093157296

Date: 2021-05-24

Welcome to SmartFast!

0x01 Summary Information

The SmartFast (SF, for short) platform received this smart contract security audit application and audited the contract in May 2021.

It is necessary to declare that SF only issues this report in respect of facts that have occurred or existed before the issuance of this report, and undertakes corresponding responsibilities for this. For the facts that occur or exist in the future, SF is unable to judge the security status of its smart contract, and will not be responsible for it. The security audit analysis and other content made in this report are based on the documents and information provided to smart analysis team by the information provider as of the issuance of this report (referred to as "provided information"). SF hypothesis: There is no missing, tampered, deleted or concealed information in the mentioned information. If the information that has been mentioned is missing, tampered with, deleted, concealed or reflected does not match the actual situation, SmartFast shall not be liable for any losses and adverse effects caused thereby.

Table 1 Contract audit information

Project	Description
Contract name	
Contract type	Ethereum contract
Code language	Solidity
Contract files	BitsForAI.sol
Contract address	
Auditors	Smart analysis team
Audit time	2021-05-24 09:31:57
Audit tool	SmartFast (SF)

Table 1 shows the relevant information of this contract audit in detail. The details and results of the contract security audit will be introduced in detail below.

0x02 Contract Audit Results

2.1 Vulnerability Distribution

The severity of vulnerabilities in this security audit is distributed according to the level of danger:

Table 2 Overview of contract audit vulnerability distribution

Vulnerability security distribution				
High	Medium	Low	Info	Opt
0	21	0	71	1

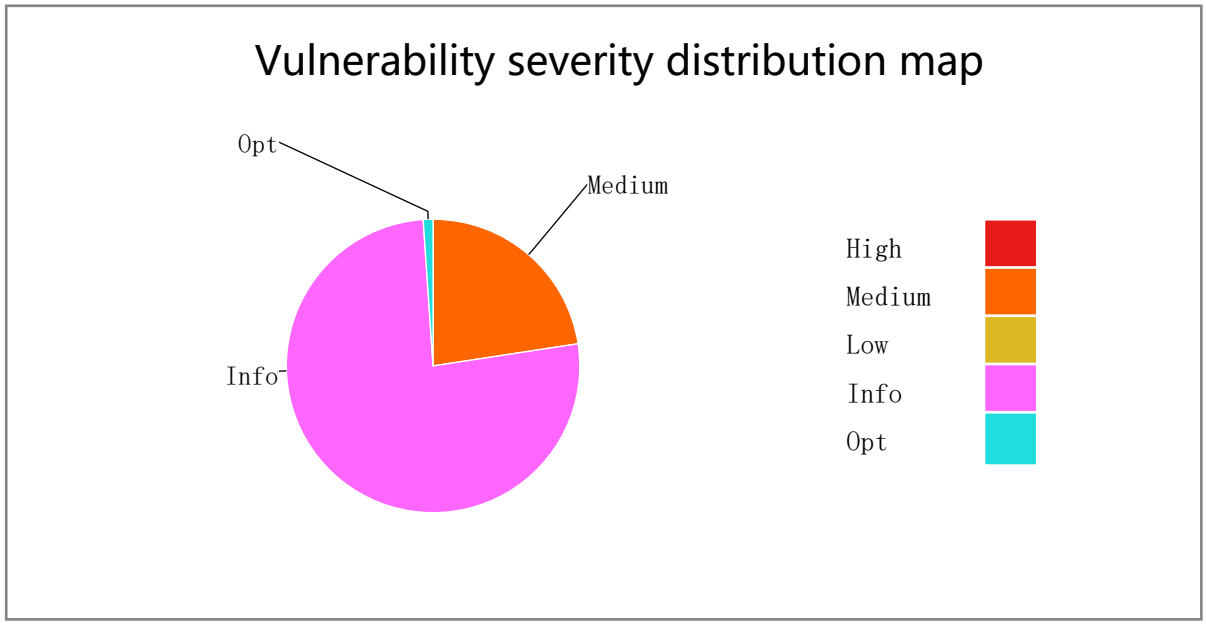

Figure 1 Vulnerability security distribution map

This security audit found 0 High-severity vulnerabilities, 21 Medium-severity vulnerabilities, 0 Low-severity vulnerabilities, 1 Optimization-severity vulnerabilities, and 71 places that need attention.

2.2 Audit Results

There are 119 test items in this security audit, and the test items are as follows (other unknown security vulnerabilities are not included in the scope of responsibility of this audit):

Table 3 Contract audit items

ID	Pattern	Description	Severity	Confidence	Status/Num
1	abiencoderv2-array	ABI encoding error	High	exactly	Pass
2	array-by-reference	Storage parameter usage	High	exactly	Pass
3	multiple-constructors	Multiple constructors in a contract	High	exactly	Pass

4	names-reused	Check contract name reuse	High	exactly	Pass
5	public-mappings-nested	Struct sets the nested structure of struct	High	exactly	Pass
6	rtlo	Overwritten from right to left	High	exactly	Pass
7	shadowing-state	Check state variable hiding	High	exactly	Pass
8	suicidal	Check if anyone can break the contract	High	exactly	Pass
9	uninitialized-state	Check for uninitialized state variables	High	exactly	Pass
10	uninitialized-storage	Check for uninitialized storage variables	High	exactly	Pass
11	unprotected-upgrade	Break the logic of the contract	High	exactly	Pass
12	visibility	Check visibility level error	High\Info	exactly	Pass
13	redundant-fallback	Check for redundant fallback functions	High\Opt	exactly	Pass
14	arbitrary-send	Check if Ether can be sent to any address	High	probably	Pass
15	continue-in-loop	Continue causes an infinite loop	High	probably	Pass
16	controlled-array-length	Length is allocated directly	High	probably	Pass
17	controlled-delegatecall	The delegate address out of control	High	probably	Pass
18	incorrect-constructor	Check the constructor name error	High	probably	Pass
19	parity-multisig-bug	Check for multi-signature vulnerabilities	High	probably	Pass
20	reentrancy-eth	Re-entry vulnerabilities (Ethereum theft)	High	probably	Pass
21	storage-array	Signed integer array problem	High	probably	Pass
22	weak-prng	Modulo problem of parameters	High	probably	Pass
23	assert-violation	Check for incorrect use of assertions	Medium	exactly	Pass
24	constructor-return	The use of return in the constructor	Medium	exactly	Pass
25	enum-conversion	Scope of enumerated types	Medium	exactly	Pass
26	erc1155-interface	Check the wrong ERC1155 interface	Medium	exactly	Pass
27	erc1410-interface	Check the wrong ERC1410 interface	Medium	exactly	Pass
28	erc20-interface	Check for wrong ERC20 interface	Medium	exactly	Pass
29	erc223-interface	Check the wrong ERC223 interface	Medium	exactly	Pass
30	erc621-interface	Check the wrong ERC621 interface	Medium	exactly	Pass
31	erc721-interface	Check the wrong ERC721 interface	Medium	exactly	Pass
32	erc777-interface	Check the wrong ERC777 interface	Medium	exactly	Pass
33	erc875-interface	Check the wrong ERC875 interface	Medium	exactly	Pass
34	incorrect-equality	Check the strict equality of danger	Medium	exactly	Pass
35	incorrect-signature	Check for incorrect function signatures	Medium	exactly	Pass

36	locked-ether	Whether the contract ether is locked	Medium	exactly	Pass
37	mapping-deletion	Delete the mapped structure problem	Medium	exactly	Pass
38	shadowing-abstract	State variables from the abstract contract	Medium	exactly	Pass
39	tautology	Check for tautologies or contradictions	Medium	exactly	Pass
40	default-return-value	Function returns only default value	Medium	probably	Pass
41	boolean-cst	Check for misuse of Boolean constants	Medium	probably	Pass
42	constant-function-state	Check Constant function to change state	Medium	probably	Medium:8
43	divide-before-multiply	Imprecise order of arithmetic operations	Medium	probably	Pass
44	erc20-approve	ERC-20 advance attack (TOD)	Medium	probably	Pass
45	function-problem	Abnormal termination of contract function	Medium	probably	Pass
46	mul-var-len-arguments	Hash collisions with multiple variable	Medium	probably	Pass
47	reentrancy-no-eth	Re-entry vulnerabilities (no ether theft)	Medium	probably	Pass
48	reused-constructor	Constructor conflict problem in the contract	Medium	probably	Pass
49	tx-origin	Check the dangerous use of tx.origin	Medium	probably	Pass
50	typographical-error	Check for writing errors (=+)	Medium	probably	Pass
51	unchecked-lowlevel	Check for uncensored low-level calls	Medium	probably	Pass
52	unchecked-send	Check unreviewed send	Medium	probably	Pass
53	uninitialized-local	Check for uninitialized local variables	Medium	probably	Pass
54	unused-return	Check if there is an unused return value	Medium	probably	Pass
55	writeto-arbitrarystorage	It can be written to any storage location	Medium	probably	Pass
56	integer-overflow	Check for integer overflow	Medium	probably	Pass
57	costly-loop	Check for too expensive loops	Medium	possibly	Medium:13
58	shift-parameter-mixup	Check reversible shift operation	Medium	possibly	Pass
59	shadowing-builtin	Check the hiding of built-in symbols	Low	exactly	Pass
60	shadowing-function	Check function hiding	Low	exactly	Pass
61	shadowing-local	Check local variable hiding	Low	exactly	Pass
62	transfer-to-zeroaddress	The withdrawal address is 0x0	Low	exactly	Pass
63	uninitialized-fptr-cst	Uninitialized pointers in constructor	Low	exactly	Pass
64	variable-scope	Check the declaration of variables	Low	exactly	Pass
65	void-cst	Calls to unimplemented constructors	Low	exactly	Pass
66	incorrect-modifier	Restore abnormal Modifier	Low	exactly	Pass
67	assemblycall-rewrite	Assemblycall covers the input	Low	probably	Pass

68	block-other-parameters	Hazardous use variables (block.number etc.)	Low	probably	Pass
69	calls-loop	Check the external call in the loop	Low	probably	Pass
70	events-access	The loss of key access control parameters	Low	probably	Pass
71	events-maths	The loss of key arithmetic parameters	Low	probably	Pass
72	extcodesize-invoke	Check Extcodesize call	Low	probably	Pass
73	fllback-outofgas	The fallback function is too complicated	Low	probably	Pass
74	incorrect-blockhash	Incorrect use of Blockhash function	Low	probably	Pass
75	incorrect-inheritance-order	The inherited variables conflict	Low	probably	Pass
76	missing-zero-check	Check the use of zero addresses	Low	probably	Pass
77	reentrancy-benign	Reentrant vulnerabilities (continuous calls)	Low	probably	Pass
78	reentrancy-events	Reentrant vulnerabilities (events)	Low	probably	Pass
79	timestamp	The dangerous use of block.timestamp	Low	probably	Pass
80	signature-malleability	The signature contains an existing signature	Low	possibly	Pass
81	assembly	Unsafe use of assembly	Info	exactly	Info:15
82	assert-state-change	Incorrect use of assert()	Info	exactly	Pass
83	delete-dynamic-arrays	The deletion of the dynamic storage array	Info	exactly	Pass
84	deprecated-standards	Solidity deprecated instructions	Info	exactly	Pass
85	erc20-indexed	ERC20 event parameter is missing indexed	Info	exactly	Pass
86	erc20-throw	ERC20 throws an exception	Info	exactly	Pass
87	length-manipulation	Unsafe operation to check array length	Info	exactly	Info:2
88	low-level-calls	Check low-level calls	Info	exactly	Pass
89	msgvalue-equals-zero	The judgment of msg.value and zero	Info	exactly	Pass
90	naming-convention	The naming follows the Solidity format	Info	exactly	Pass
91	pragma	Undeclared multiple compiled versions	Info	exactly	Pass
92	solc-version	Check for incorrect Solidity version	Info	exactly	Pass
93	unimplemented-functions	Functions overloaded in the contract	Info	exactly	Pass
94	upgrade-050	Code for Solidity 0.5.x upgrade	Info	exactly	Pass
95	function-init-state	State variables initialized by functions	Info	exactly	Pass
96	complex-function	Check complex functions	Info	probably	Pass
97	hardcoded	Check the legitimacy of the address	Info	probably	Info:16
98	overpowered-role	The permissions are too concentrated	Info	probably	Pass
99	reentrancy-limited-events	Reentrancy vulnerabilities (limited events)	Info	probably	Pass

100	reentrancy-limited-gas	Reentry (send and transfer, with eth)	Info	probably	Pass
101	reentrancy-limited-gas-no-eth	Reentrance (send and transfer, no eth)	Info	probably	Pass
102	similar-names	Detect similar variables	Info	probably	Pass
103	too-many-digits	Too many number symbols	Info	probably	Pass
104	private-not-hidedata	Check the use of private visibility	Info	possibly	Info:35
105	safemath	Check the use of SafeMath	Info	possibly	Info:3
106	array-instead-bytes	The byte array can be replaced with bytes	Opt	exactly	Pass
107	boolean-equal	Check comparison with boolean constant	Opt	exactly	Pass
108	code-no-effects	Check for invalid codes	Opt	exactly	Pass
109	constable-states	State variables can be declared as constants	Opt	exactly	Pass
110	event-before-revert	Check if event is called before revert	Opt	exactly	Pass
111	external-function	Public functions can be declared as external	Opt	exactly	Pass
112	extra-gas-inloops	Check for additional gas consumption	Opt	exactly	Pass
113	missing-inheritance	Detect lost inheritance	Opt	exactly	Pass
114	redundant-statements	Detect the use of invalid sentences	Opt	exactly	Pass
115	return-struct	Multiple return values (struct)	Opt	exactly	Pass
116	revert-require	Check Revert in if operation	Opt	exactly	Opt:1
117	send-transfer	Check Transfe to replace Send	Opt	exactly	Pass
118	unused-state	Check unused state variables	Opt	exactly	Pass
119	costly-operations-loop	Expensive operations in the loop	Opt	probably	Pass

0x03 Contract Code

3.1 Code and Vulnerability Lables

In the corresponding position of each contract code, security vulnerabilities and coding specification issues have been marked in the form of comments. The comment labels start with //StFt. For details, please refer to the following contract code content.

```
// File: node_modules\@openzeppelin\contracts\math\SafeMath.sol

pragma solidity ^0.5.0;

/**
 * @dev Wrappers over Solidity's arithmetic operations with added overflow
 * checks.
 *
 * Arithmetic operations in Solidity wrap on overflow. This can easily result
```

```
* in bugs, because programmers usually assume that an overflow raises an
* error, which is the standard behavior in high level programming languages.
* `SafeMath` restores this intuition by reverting the transaction when an
* operation overflows.
*
* Using this library instead of the unchecked operations eliminates an entire
* class of bugs, so it's recommended to use it always.
*/
library SafeMath {
    /**
     * @dev Returns the addition of two unsigned integers, reverting on
     * overflow.
     *
     * Counterpart to Solidity's `+` operator.
     *
     * Requirements:
     * - Addition cannot overflow.
     */

```

0x04 Contract Audit Details

4.1 constant-function-state

Vulnerability description

Functions declared as constant/pure/view will change their state. Constant/pure/view was not enforced before Solidity 0.5. Starting from Solidity 0.5, calls to constant/pure/view functions use the STATICCALL opcode, which is restored when the state is modified. As a result, calls to incorrectly labeled functions may catch contracts compiled with Solidity 0.5.

Audit results: 【Medium:8】

For this pattern, the specific problems in the contract are as follows:

(Medium)function init(buffer memory _buf, uint _capacity) internal pure { (tests/time_2/BitsForAI.sol)#1399

(Medium)function append(buffer memory _buf, bytes memory _data) internal pure returns (buffer memory _buffer) { (tests/time_2/BitsForAI.sol)#1433

(Medium)function append(buffer memory _buf, uint8 _data) internal pure { (tests/time_2/BitsForAI.sol)#1471

(Medium)function appendInt(buffer memory _buf, uint _data, uint _len) internal pure returns (buffer memory _buffer) { (tests/time_2/BitsForAI.sol)#1492

(Medium)function copyBytes(bytes memory _from, uint _fromOffset, uint _length, bytes memory _to, uint _toOffset) internal pure returns (bytes memory _copiedBytes) { (tests/time_2/BitsForAI.sol)#2558

(Medium)function safeMemoryCleaner() internal pure { (tests/time_2/BitsForAI.sol)#2645

(Medium)function isContract(address account) internal view returns (bool) { (tests/time_2/BitsForAI.sol)#427

(Medium)function getCodeSize(address _addr) view internal returns (uint _size) { (tests/time_2/BitsForAI.sol)#2167

Security advice

Ensure that the properties of the contract compiled before Solidity 0.5.0 are correct.

4.2 costly-loop

Vulnerability description

Ethereum is a very resource-constrained environment. The price of each calculation step is several orders of magnitude higher than the price of the centralized provider. In addition, Ethereum miners impose limits on the total amount of natural gas consumed in the block. If array.length is large enough, the function exceeds the gas limit, and the transaction that calls the function will never be confirmed. If external participants influence array.length, this will become a security issue.

Audit results: 【Medium:13】

For this pattern, the specific problems in the contract are as follows:

(Medium)for (uint i = 0; i < minLength; i ++) { (tests/time_2/BitsForAI.sol)#2216

(Medium)for (uint i = 0; i < h.length; i++) { (tests/time_2/BitsForAI.sol)#2241

(Medium)for (i = 0; i < _ba.length; i++) { (tests/time_2/BitsForAI.sol)#2278

(Medium)for (i = 0; i < _bb.length; i++) { (tests/time_2/BitsForAI.sol)#2281

(Medium)for (i = 0; i < _bc.length; i++) { (tests/time_2/BitsForAI.sol)#2284

(Medium)for (i = 0; i < _bd.length; i++) { (tests/time_2/BitsForAI.sol)#2287

(Medium)for (i = 0; i < _be.length; i++) {
(tests/time_2/BitsForAI.sol)#2290

(Medium)for (uint i = 0; i < bresult.length; i++) {
(tests/time_2/BitsForAI.sol)#2304

(Medium)for (uint i = 0; i < bresult.length; i++) {
(tests/time_2/BitsForAI.sol)#2333

(Medium)for (uint i = 0; i < _arr.length; i++) {
(tests/time_2/BitsForAI.sol)#2378

(Medium)for (uint i = 0; i < _arr.length; i++) {
(tests/time_2/BitsForAI.sol)#2390

(Medium)subindex < n.length && (i + subindex) < h.length && h[i + subindex] == n[subindex]) { (tests/time_2/BitsForAI.sol)#2244

(Medium)i < (32 + _fromOffset + _length)) {
(tests/time_2/BitsForAI.sol)#2563

Security advice

Please check the dynamic array of the loop carefully. If you find it can be exploited by an attacker, please change it to prevent the contract from executing too many loops and causing gas overflow and rollback.

4.3 assembly

Vulnerability description

Inline assembly is to access the Ethereum virtual machine from a low level, which leads to the abandonment of several important security features of Solidity.

Audit results: 【Info:15】

For this pattern, the specific problems in the contract are as follows:

(Informational)assembly { codehash := extcodehash(account) }
(tests/time_2/BitsForAI.sol)#438

(Informational)assembly { (tests/time_2/BitsForAI.sol)#1405

(Informational)assembly { (tests/time_2/BitsForAI.sol)#1440

(Informational)assembly { (tests/time_2/BitsForAI.sol)#1448

(Informational)assembly { (tests/time_2/BitsForAI.sol)#1455

(Informational)assembly { (tests/time_2/BitsForAI.sol)#1475

(Informational)assembly { (tests/time_2/BitsForAI.sol)#1497

(Informational)assembly { (tests/time_2/BitsForAI.sol)#2405
(Informational)assembly { (tests/time_2/BitsForAI.sol)#2417
(Informational)assembly { (tests/time_2/BitsForAI.sol)#2425
(Informational)assembly { (tests/time_2/BitsForAI.sol)#2455
(Informational)assembly { (tests/time_2/BitsForAI.sol)#2564
(Informational)assembly { (tests/time_2/BitsForAI.sol)#2588
(Informational)assembly { (tests/time_2/BitsForAI.sol)#2614
(Informational)assembly { (tests/time_2/BitsForAI.sol)#2646

Security advice

Check the inline assembly instructions carefully to make sure they can run safely, otherwise they need to be replaced.

4.4 length-manipulation

Vulnerability description

The length of the dynamic array changes directly. In this case, huge arrays may appear, and storage overlap attacks (conflicts with other data in the storage) may result. The operations of "length" are: =, +=, -=, *=, /=, --, etc.

Audit results: 【Info:2】

For this pattern, the specific problems in the contract are as follows:

(Informational)_ownedTokens[from].length--; (tests/time_2/BitsForAI.sol)#1107

(Informational)_allTokens.length--; (tests/time_2/BitsForAI.sol)#1134

Security advice

Carefully check the operation of the dynamic array to see if the array can be added arbitrarily by the attacker.

4.5 hardcoded

Vulnerability description

The contract contains an unknown address, which may be used for some malicious activities. Need to check the hard-coded address and its purpose. The address length is prone to errors, and the length of the address is not enough, it will not report an error, so it is very dangerous to write a mistake. Here is an identification.

Audit results: 【Info:16】

For this pattern, the specific problems in the contract are as follows:

(Informational)0x1d3B2638a7cC9f2CB3D298A3DA7a90B67E5506ed) > 0) { //mainnet (tests/time_2/BitsForAI.sol)#1641

(Informational)0x1d3B2638a7cC9f2CB3D298A3DA7a90B67E5506ed); (tests/time_2/BitsForAI.sol)#1642

(Informational)0xc03A2615D5efaf5F49F60B7BB6583eaec212fdf1) > 0) { //ropsten testnet (tests/time_2/BitsForAI.sol)#1646

(Informational)0x20e12A1F859B3FeaE5Fb2A0A32C18F5a65555bBF); (tests/time_2/BitsForAI.sol)#1671

(Informational)0x51efaF4c8B3C9AfBD5aB9F4bbC82784Ab6ef8fAA) > 0) { //browser-solidity (tests/time_2/BitsForAI.sol)#1674

(Informational)0x51efaF4c8B3C9AfBD5aB9F4bbC82784Ab6ef8fAA); (tests/time_2/BitsForAI.sol)#1675

Security advice

Check carefully whether the address is wrong, and if there is an error, please take the time to correct it.

4.6 private-not-hidedata

Vulnerability description

Contrary to common understanding, the private modifier does not make variables invisible, and miners can access the code and data of all contracts. Developers must solve the problem of Ethereum's lack of privacy. Although it is private, it can be viewed by miners.

Audit results: 【Info:35】

For this pattern, the specific problems in the contract are as follows:

(Informational)private _owner; (tests/time_2/BitsForAI.sol)#236

(Informational)private constant _INTERFACE_ID_ERC165 = 0x01ffc9a7; (tests/time_2/BitsForAI.sol)#533

(Informational)private _symbol = "BFA"; (tests/time_2/BitsForAI.sol)#2671

(Informational)private _tokenURI = "https://api.bitsforai.com/tokenid/"; (tests/time_2/BitsForAI.sol)#2672

(Informational)private _currentTokenId; (tests/time_2/BitsForAI.sol)#2673

(Informational)private GWEI = 1000000000; (tests/time_2/BitsForAI.sol)#2675

(Informational)private gasPrice = 4010000000; //many set exactly 4gwei, so adding 0.01 gwei increases speed much more than expected. (tests/time_2/BitsForAI.sol)#2676

(Informational)private gasAmount = 250000; (tests/time_2/BitsForAI.sol)#2677

(Informational)private BASIS_POINTS = 10000; (tests/time_2/BitsForAI.sol)#2679

(Informational)private NUM_RANDOM_BYTES_REQUESTED = 2; //The variable `ceiling` should never be greater than: `(256 ^ NUM_RANDOM_BYTES_REQUESTED) -

1`. (tests/time_2/BitsForAI.sol)#2681

Security advice

Carefully check the writing logic to ensure that the private variables you write can be seen, otherwise you should pay attention to privacy and use encryption and other means.

4.7 safemath

Vulnerability description

SafeMath library is used. It is good to use SafeMath, but if it is modified, it will also cause some loopholes. It should be noted that we call for the use of the safemath library, but care should be taken not to modify it at will.

Audit results: 【Info:3】

For this pattern, the specific problems in the contract are as follows:

(Informational)using SafeMath for uint256; (tests/time_2/BitsForAI.sol)#496

(Informational)using SafeMath for uint256; (tests/time_2/BitsForAI.sol)#588

(Informational)using SafeMath for uint; (tests/time_2/BitsForAI.sol)#2665

Security advice

Carefully check the relevant functions of the safemath library to ensure that there are no loopholes.

4.8 revert-require

Vulnerability description

if (condition) {revert(); or throw;} can be replaced by require(condition) to save resources and gas.

Audit results: 【Opt:1】

For this pattern, the specific problems in the contract are as follows:

(Optimization)if (uint(uint8(bresult[i])) == 46) { (tests/time_2/BitsForAI.sol)#2312

Security advice

Use require(condition) instead of constructing if (condition) {revert(); or throw;}.

Thanks for using the SmartFast contract audit platform!
